valve control allows the lift, duration and/or timing of the intake or exhaust valves to be altered while the engine is in operation. Two camshafts (DOHC), one operating intake valves and the other exhaust valves, are located above each bank of cylinders. The design is very adaptable to multiple intake and exhaust valves.

Safety and Security

- Brake assist senses panic braking from the speed of the brake pedal's travel and applies all available power brake boost.
- Ignition immobilizer is a passive means of security. It consists of a transmitter embedded within the ignition key and a sensor located in the vehicle. These two circuits must be present, and must recognize each other before the vehicle will start.
